Various 4K/12G Display Modes

Single Link 12G-SDI (OBM-8K/U/W Series)

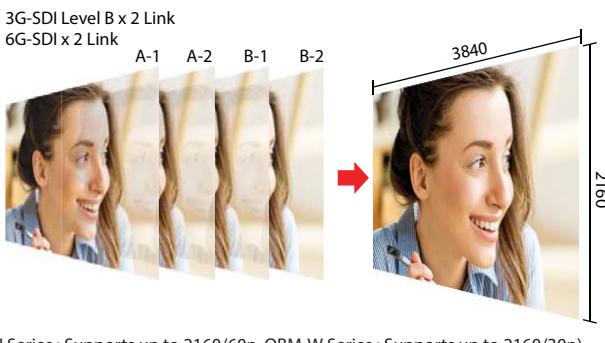

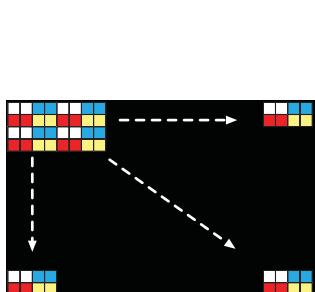

Quad Link 2 Sample Interleave (2-S.I.) (OBM-8K/U Series)

Each link contains a full image at 1/4 resolution. 2-S.I. mode uses four sub-image and alternates the samples every two pixels and every line instead of slitting the image into four quadrants.

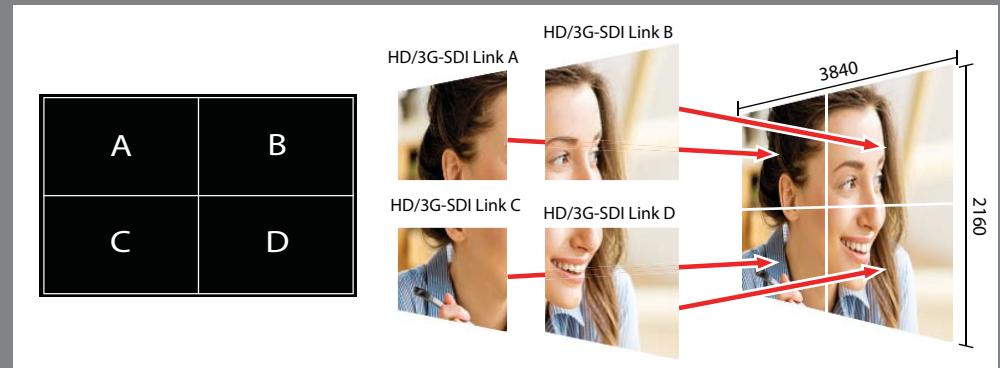

Dual Link 2-Sample Interleave(2-S.I.) (OBM-8K/U/W Series)

(*OBM-U Series : Supports up to 2160/60p. OBM-W Series : Supports up to 2160/30p)

Quad Link Square Division (OBM-8K/U Series)

Each link contains one square of the original image.

Fast Mode (OBM-U/W/P/N/L/H/R Series)

This function minimizes the internal video processing time from the signal input to the display on the screen. This function is useful when monitoring the fast-moving video content and checking the line flicker.

***8K monitors are in fast mode and FLICKER FREE by default even if you do not turn on/off any special functions.

Internal Video Processing Time

Input Signal	Fast Mode Off	Fast Mode On
2160/60p	1 frame x (1/60sec) = 17ms	0.02 frame x (1/60sec) = 0.33ms
2160/50p	1 frame x (1/50sec) = 20ms	0.02 frame x (1/50sec) = 0.40ms

Gamut Error (OBM-8K/U/W/N/L/H/R Series)

The total range of the SDI 10bit signal is 0 to 1023. The range 0 to 3 and 1020 to 1023 are the reserved values for Sync, and the total video signal range is 4 to 1019.

In a video signal, each primary component should lie between 0 and 100% of the video range between black level and peak level (R and G and B).

Ideally, video levels should lie within the specified limits so that programs can be distributed without adjustment.

100% White pattern: Y - 940, Cb - 512, Cr - 512

0% Black pattern: Y - 64, Cb - 512, Cr - 512

Expected Video Range: 64 to 940

System Bit Depth	Range in Digital Sample (Code) Values		
	Expected Video Range	Preferred Min. / Max.	Total Video Signal Range
10 bit	64 - 940	20 - 984	4 - 1019

*References: EBU R 103 Version 2.0 page 4, Annex 1

In practice, it is difficult to avoid generating signals slightly out of range, and it is considered reasonable to allow a small tolerance. Therefore, the EBU recommends that the RGB components and the corresponding Luminance (Y) signal should not normally exceed the "preferred minimum/maximum" range of digital sample levels in the table above.

Type 1: Black Zebra

When the targeted color space is selected as BT.709, the pixels outside of the targeted color space are displayed as Black Zebra.

The pixels over Y Maximum, Chroma Maximum, RGB Maximum are displayed as Black Zebra, and the pixels below Y Minimum, Chroma Minimum, RGB Minimum are also displayed as Black Zebra.

Type 2: Black & White Zebra

When the targeted color space is selected as BT.709, the pixels outside of the targeted color space are displayed as Black or White Zebra. The pixels over Y Maximum, Chroma Maximum, RGB Maximum are displayed as Black Zebra, and the pixels below Y Minimum, Chroma Minimum, RGB Minimum are displayed as White Zebra.

Type 3: Mono

When the targeted color space is selected as BT.709, the pixels inside of the targeted color space are displayed as Mono, and the pixels outside of the targeted color space are displayed as the color. In this type, black and white area is not recognized.

In-Monitor Display(IMD) (OBM-8K/U/W/N/L/H/Q/R Series)

The image source names and tally information can be displayed on the screen, with an external remote function via Ethernet. The TSL system protocol is supported. The color of the source name and tally color can be selectable among White, Red, Green, Blue, Yellow, Cyan, Magenta.

Password Lock for User Preset (OBM-8K/U/W/N/L/H/R Series)

When multiple users share the same monitor, each user can register his/her own password for color temperature and user preset data. This ensures the users correctly recall their preset data, and keep preset information safe from unauthorized use.

Custom 3D LUT File Import (OBM-8K/U/W/N/L/H/R Series)

The OBM series allow the user to import 3D Look-up Table for accurate and consistent color matching between individual displays as well as using customized 'looks' that have been created by 3rd party color-grading applications. 32^3 , 33^3 , 64^3 , 65^3 cube file are supported.

Focus Assist(OBM-8K/U/W/N/L/H/R Series)

This function controls the aperture level of a video signal, and displays images on screen with sharpened edges to help camera focus operation.

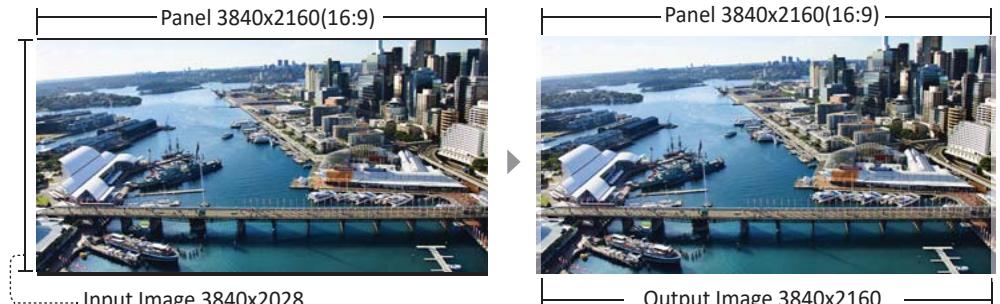

Scan Mode (OBM-8K Series)

4K/QFHD Mode

The LCD panel resolution of OBM-U318K/278K/248K is QFHD(16:9) 3840x2160, so if the input signal is 3840x2160 1:1 mapping is supported. If the input signal is DCI 4K(4096x2160), 1:1 mapping is not supported.

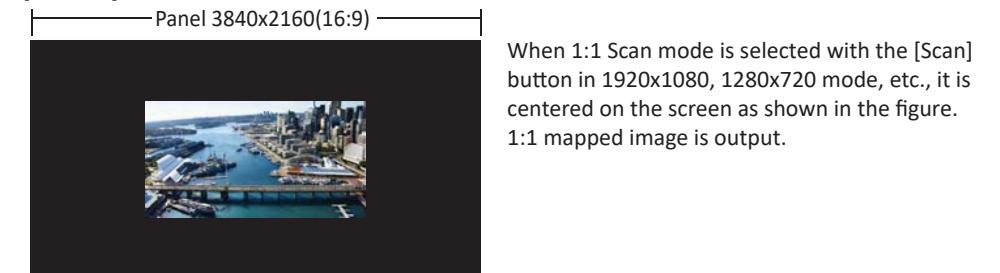

[Zero Scan]

Input Image 3840x2028

When the 4096x2160 signal is fed, if you select Zero Scan button on the front panel, the pictures is Scaled to be displayed on the panel of 3840x2048 resolution with maintaining 1.89:1 ratio

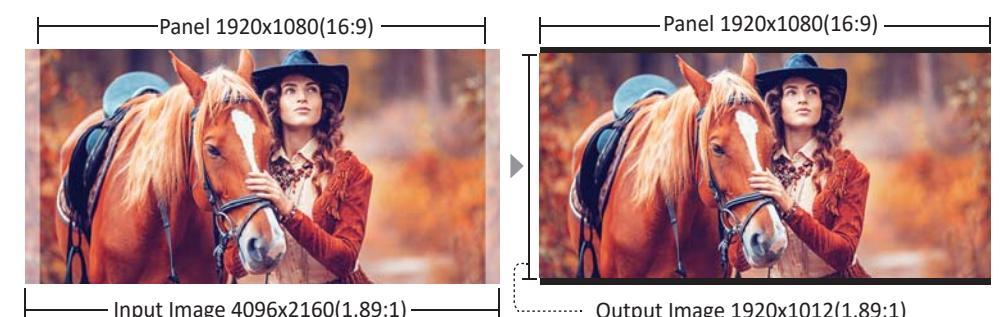

[1:1 Scan]

When 1:1 Scan mode is selected with the [Scan] button in 1920x1080, 1280x720 mode, etc., it is centered on the screen as shown in the figure. 1:1 mapped image is output.

Scan Mode (OBM-U/W Series)

When the 4096 x 2160(1.89:1) signal is fed to the 1920x1080(16:9) resolution screen, if you select Zero Scan mode, the whole picture is displayed on the screen, with maintaining 1.89:1 ratio.

Apply 3D LUT

The main function of the product is to apply 3D LUT.
 PICS-L is a stand-alone converter which supports up-conversion and down-conversion between 4K and HD. And, the 12G-SDI single link video input can be output to 3G-SDI quad link.
 As the control panel disappears, control is performed using a PC.
 Advanced 3D LUT Tetrahedral Interpolation algorithm has been applied to the PICS-L.
 The accuracy of the color reproduction is better than 33x33x33 grid 3D LUT with cubic interpolation.

3D LUT Select

3D LUT 1 ~ 10 - For 3D LUT 1-10, you can assign a 3D LUT by importing ".cube" files.

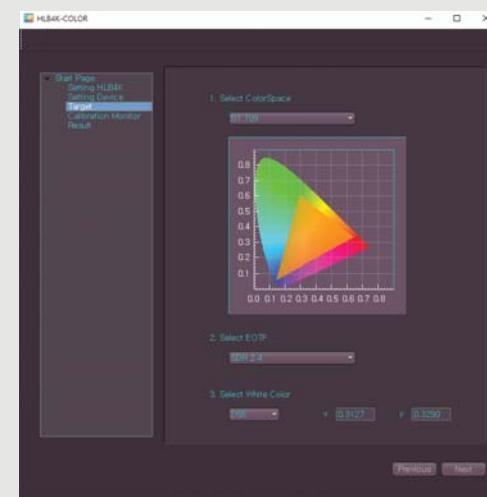

System Control

Back-up - Exporting/Importing setting data to PC available. Allows much easier control of building the systems.
